13	Activity Report : Vermicompost is an Extension activity of the Department of zoology. This activity is running by this department since the year 2003. We used cement tanks (1.2x2x1 feet) for the preparation of compost. Four cement tanks were arranged on the plane platform behind the wall of the zoology laboratory. The cement tanks were specially designed for the compost. One outlet for drainage is made at the base and six ventilators wholes were made at the neck region. *Eiseina foetida* is the fast growing and most commonly used species of earthworm were used for the culture. These seeds of these worms were the product of our own compost and we are self sufficient as we have our own culture. The beds were prepared by using the college garden waste materials, lawn cuttings, cow dung, etc. Water was daily showered to maintain the moisture. As the compost tanks are on the ground there is a threat for the insects particularly from the red ants. So to protect them insecticide were used. The white chalk "Laxmanrekha" is most effective. After every month or a two, compost was collected. The compost then filtered and packed in polythene bags. 1Kg packing was made and the same were labeled by the student of B.Sc, and the members of Nature Club. The compost was sold among the staff members and the students of the college. The collected amount was deposited in the college office. In this year 2016-17 Rs. 440/- (Four hundred forty only) were deposited on 23rd March 2017.
14	Outcome: Deposited Rs.440/- in college office, Soft skill development for the students, by preparing vermicompost.

13	Activity Report : Vermicompost is an Extension activity of the Department of zoology. This activity is running by this department since the year 2003. We used cement tanks (1.2x2x1 feet) for the preparation of compost. Four cement tanks were arranged on the plane platform behind the wall of the zoology laboratory. The cement tanks were specially designed for the compost. One outlet for drainage is made at the base and six ventilators wholes were made at the neck region. *Eiseina foetida* is the fast growing and most commonly used species of earthworm were used for the culture. These seeds of these worms were the product of our own compost and we are self sufficient as we have our own culture. The beds were prepared by using the college garden waste materials, lawn cuttings, cow dung, etc. Water was daily showered to maintain the moisture. As the compost tanks are on the ground there is a threat for the insects particularly from the red ants. So to protect them insecticide were used. The white chalk "Laxmanrekha" is most effective. After every month or a two, compost was collected. Earn While You Learn Scheme

Introduction

This earn while you learn scheme aims towards the fulfillment of the aim and object of the college of helping the financially weak students to continue their education and to help them to procure study material in addition to providing the best education. This also aims towards cultivating in students the moral and ethical value of work culture during the period of education. By this scheme the college management also shares its responsibility towards upliftment of poor and needy students by providing them the monitory help for the work done in the college.

Doing a part time job and supporting the family and self education is the basic requirement in socio economically backward students. Various part-time job opportunities are provided to the students within the campus.In the part-time job students have to work in Library, Computer,Chemistry,Physics,Mathematics,Botany,Zoology,Electronics, B.C.A.,Statistics as well as Commerce and management departments also as student teachers of Muktangan activity of the college.

Also, the college provides its budding entrepreneurs with necessary guidance and resources to initiate and run their entrepreneurial ventures as well as provides for incubation of their business ideas.
